Other Dun considered

The WABA are registering duns that carry the silver gene and testing any Red Duns that may be carrying the silver gene. Progeny of Silver/Dun that do not inherit the dun gene are **not** considered for Appendix registration.

** It should be noted that it is relevant to Cremello, Chestnut and Palomino whether they carry Agouti in any form or not. Agouti is always carried dominantly but is considered not to be visible in these colours. Hence the outcome of the colour of progeny that could inherit black may be effected when breeding with Cremello, Chestnut and Palomino.

*** It should also be noted that the Silver/Taffy gene can be carried by Cremello, Chestnut and Palomino in the same way as Agouti, dominantly but is presumably not seen. There seems to be some contradiction to this as it is possible to see the effect of silver/taffy with palomino and it can put a light shadowed effect over the coat.

The WABA do not register any combination of Silver/Taffy or Cream, this is termed as "muddled colour" and is unpredictable in appearance.
